estimate of intelligibility for the user's message may be calculated and compared to an intelligibility threshold to determine whether the calculated estimate of intelligibility is below the intelligibility threshold. If any of the measured speech level, measured signal-to-noise ratio and calculated estimate of intelligibility of the user's message are determined to be below their respective thresholds, the user may be prompted to repeat at least a portion of the message.

### **BRIEF DESCRIPTION OF THE DRAWINGS**

[0006] Embodiments of the present invention are illustrated by way of example, and not limitation, in the accompanying figures in which like references denote similar elements, and in which:

[0007] FIG. 1 is a block diagram of a speech verification system in accordance with an embodiment of the present invention;

[0008] FIG. 2 illustrates a block diagram of a speech verification device in accordance with an embodiment of the present invention; and

[0009] FIG. 3 is flowchart showing a speech verification method in accordance with an exemplary embodiment of the present invention.

### **DETAILED DESCRIPTION**

[0010] FIG. 1 is a block diagram of a speech verification system 100 according to an exemplary embodiment of the present invention. The speech verification system 100 may include an automatic speech verification device (SVD) 150 in accordance with an embodiment of the present invention.

[0011] The SVD 150 may monitor, in real time, a message received from a user for various characteristics of the user's message to verify that the message will be sufficiently intelligible when played back and/or processed by a human and/or a machine. For example, the SVD 150 may determine whether there is
